

CENG381 Stochastic Processes

Rate of Convergence - Question Set 1

Q1 (30 points). Consider the 2-state Markov chain on $\{E, W\}$ with transition matrix:

$$\begin{array}{cc} & \begin{array}{cc} E & W \end{array} \\ \begin{array}{c} E \\ W \end{array} & \begin{bmatrix} 0.7 & 0.3 \\ 0.4 & 0.6 \end{bmatrix} \end{array}$$

- a) Find the stationary distribution $\pi = (\pi_E, \pi_W)$.
 - b) Define $\Delta_t = \mu_t(E) - \pi_E$. Show that $\Delta_{t+1} = (1-p-q) * \Delta_t$, where $p = 0.3$ and $q = 0.4$, and identify the rate of convergence $\lambda_2 = 1-p-q$.
 - c) If the chain starts at E ($\mu_0(E)=1$), how many steps are needed until $|\Delta_t| < 0.01$? (Use the formula $\Delta_t = \lambda_2^t * \Delta_0$.)
-

Q2 (35 points). A Markov chain on $\{0, 1\}$ has transition matrix P with eigenvalues $\lambda_1 = 1$ and $\lambda_2 = 1 - p - q$. It can be diagonalized as $P = S^{-1} D S$, where $D = \text{diag}(1, \lambda_2)$.

- a) For $p = 0.2$, $q = 0.5$, find D and write P in diagonalized form.
 - b) Use $P = S^{-1} D S$ to derive an explicit formula for P^n , the n -step transition matrix.
 - c) Compute $P^{(33)}$ for the entry $p_{\{EE\}}^{(33)}$. Simplify using the formula $p_{\{EE\}}^{(n)} = q/(p+q) + \lambda_2^n * p/(p+q)$.
-

Q3 (35 points). A lazy frog sits on two lily pads. To make the chain converge faster, we introduce a 'lazy' version: at each step, with probability $1/2$ the frog stays in place (does nothing), and with probability $1/2$ it follows the original transitions from matrix P below.

$$\begin{array}{cc} & \begin{array}{cc} E & W \end{array} \\ \begin{array}{c} E \\ W \end{array} & \begin{bmatrix} 0.6 & 0.4 \\ 0.3 & 0.7 \end{bmatrix} \end{array}$$

- a) Write the transition matrix Q of the lazy chain as $Q = (1/2)I + (1/2)P$.
- b) Find the eigenvalues of Q . How does $\lambda_2(Q)$ compare to $\lambda_2(P)$?
- c) The rate of convergence of the lazy chain is $|\lambda_2(Q)|$. Is the lazy chain faster or slower to converge than the original? Why might one still prefer the lazy chain in practice (hint: think about periodicity)?
