

CENG381 Stochastic Processes -- Mixed Exam

Mixed Exam 2 -- Answer Key

Q1 Solution (30 points)

a) Row sums and holding times:

Row 0: $-2.0 + 1.5 + 0.5 = 0$ (OK)

Row 1: $1.0 - 3.0 + 2.0 = 0$ (OK)

Row 2: $0.5 + 1.5 - 2.0 = 0$ (OK)

$q(0) = 2.0 \Rightarrow H(0) \sim \text{Exponential}(2.0), \quad E[H(0)] = 0.5 \text{ time units}$

$q(1) = 3.0 \Rightarrow H(1) \sim \text{Exponential}(3.0), \quad E[H(1)] = 1/3 \text{ time units}$

$q(2) = 2.0 \Rightarrow H(2) \sim \text{Exponential}(2.0), \quad E[H(2)] = 0.5 \text{ time units}$

State 1 (Busy) has the shortest expected holding time.

b) Stationary distribution from $\pi \cdot Q = 0$:

Balance equations (rate in = rate out for each state):

$$2.0 \cdot \pi(0) = 1.0 \cdot \pi(1) + 0.5 \cdot \pi(2) \quad \dots \text{ (I)}$$

$$3.0 \cdot \pi(1) = 1.5 \cdot \pi(0) + 1.5 \cdot \pi(2) \quad \dots \text{ (II)}$$

$$2.0 \cdot \pi(2) = 0.5 \cdot \pi(0) + 2.0 \cdot \pi(1) \quad \dots \text{ (III)}$$

From (II): $\pi(1) = 0.5 \cdot \pi(0) + 0.5 \cdot \pi(2) \dots \text{ (II')}$

Sub into (I): $2 \cdot \pi(0) = 0.5 \cdot \pi(0) + 0.5 \cdot \pi(2) + 0.5 \cdot \pi(2)$

$$2 \cdot \pi(0) = 0.5 \cdot \pi(0) + \pi(2) \Rightarrow \pi(2) = 1.5 \cdot \pi(0)$$

From (II'): $\pi(1) = 0.5 \cdot \pi(0) + 0.5 \cdot (1.5 \cdot \pi(0)) = 0.5 \cdot \pi(0) + 0.75 \cdot \pi(0) = 1.25 \cdot \pi(0)$

Normalise: $\pi(0) + 1.25 \cdot \pi(0) + 1.5 \cdot \pi(0) = 1 \Rightarrow 3.75 \cdot \pi(0) = 1$

$$\pi(0) = 4/15, \quad \pi(1) = 5/15 = 1/3, \quad \pi(2) = 6/15 = 2/5$$

Check: $4/15 + 5/15 + 6/15 = 15/15 = 1$ (OK)

c) Detailed balance test between states 0 and 2:

$$\pi(0) \cdot Q(0,2) = (4/15) \cdot 0.5 = 2/15$$

$$\pi(2) \cdot Q(2,0) = (6/15) \cdot 0.5 = 3/15$$

$2/15 \neq 3/15$, so detailed balance does NOT hold between 0 and 2.

The chain is NOT reversible.

Q2 Solution (35 points)

CENG381 Stochastic Processes -- Mixed Exam

Mixed Exam 2 -- Answer Key

a) ρ , $\pi(n)$, $P(N > 3)$:

$$\begin{aligned}\rho &= \lambda/\mu = 5/8 = 0.625 < 1 \Rightarrow \text{queue is stable} \\ \pi(n) &= (1 - \rho) * \rho^n = 0.375 * (0.625)^n \\ \pi(0) &= 0.375 \quad (\text{server idle 37.5\% of the time})\end{aligned}$$

$P(\text{more than 3 customers}) = P(N \geq 4) = \rho^4$:

$$P(N \geq 4) = \rho^4 = (0.625)^4 = 0.1526 \quad (\text{about 15.3\%})$$

b) $E[N]$, $E[T]$, $E[T_q]$:

$$\begin{aligned}E[N] &= \rho / (1 - \rho) = 0.625 / 0.375 = 5/3 \sim 1.667 \text{ customers} \\ E[T] &= E[N] / \lambda = (5/3) / 5 = 1/3 \text{ hour} = 20 \text{ minutes} \\ E[T_q] &= E[T] - 1/\mu = 1/3 - 1/8 = 8/24 - 3/24 = 5/24 \text{ hour} \sim 12.5 \text{ minutes}\end{aligned}$$

c) Server vacation effect (qualitative):

Waiting to accumulate 2 customers before starting service means customers who arrive when 0 or 1 are in the system must wait even though the server is idle. This increases the average waiting time and $E[N]$ compared to the standard M/M/1 where service begins immediately.

Q3 Solution (35 points)

a) $P^2(0,0)$ via Chapman-Kolmogorov:

$$\begin{aligned}P^2(0,0) &= P(0,0)*P(0,0) + P(0,1)*P(1,0) \\ &= 0.6*0.6 + 0.4*0.3 \\ &= 0.36 + 0.12 = 0.48\end{aligned}$$

b) Eigenvalues of P :

With $p = P(0,1) = 0.4$ and $q = P(1,0) = 0.3$:

$$\begin{aligned}\lambda(1) &= 1 \\ \lambda(2) &= 1 - p - q = 1 - 0.4 - 0.3 = 0.3\end{aligned}$$

c) $P^n(0,0)$ using diagonalization:

$$\begin{aligned}P^n(0,0) &= q/(p+q) + \lambda(2)^n * p/(p+q) \\ &= 0.3/0.7 + (0.3)^n * 0.4/0.7 \\ &= 3/7 + (4/7) * (0.3)^n\end{aligned}$$

For $n = 3$:

CENG381 Stochastic Processes -- Mixed Exam

Mixed Exam 2 -- Answer Key

$$\begin{aligned}P^3(0,0) &= 3/7 + (4/7) \cdot (0.3)^3 = 3/7 + (4/7) \cdot 0.027 \\&= 3/7 + 0.108/7 = (3 + 0.108)/7 = 3.108/7 \sim 0.444\end{aligned}$$

As $n \rightarrow \infty$: $(0.3)^n \rightarrow 0$, so:

$$P^n(0,0) \rightarrow 3/7 \sim 0.429 = \pi(0) \quad (\text{stationary probability of state } 0)$$
